THREE-TRACK RUNWAY AND TAXIWAY PROFILES MEASURED
AT INTERNATIONAL AIRPORTS A AND B

By Albert W. Hall
Langley Research Center

SUMMARY

Three-track runway and taxiway profiles are presented for use in studies of airplane response to ground roughness. The profiles were obtained by measuring the elevation at 2-foot intervals along the center track and along tracks 15 feet on each side of the center. The elevations relative to an arbitrary datum were determined to the nearest 0.005 foot by conventional surveying methods. This report presents the tabulated and plotted profile data measured at two international airports (designated airports A and B).

INTRODUCTION

Modern computing techniques and equipment have greatly improved the capability of predicting airplane response to runway roughness if the roughness characteristics are known. The roughness characteristics can be defined basically by profiles determined from elevations measured at close intervals (usually 2 feet or less) along the length of the path to be defined. These profiles may be used directly or they may be transformed to power spectral density curves as the input data for computing airplane response.

In the past, runway profile data have been obtained by various organizations such as the National Advisory Committee for Aeronautics, the Air Force, aircraft manufacturers, and the NATO Advisory Group for Aeronautical Research and Development. Reference 1 gives a summation of existing profile data. It is not possible to determine whether these profiles are representative of current commercial airports. There is very little three-track data available and there is practically no data representative of taxiway profiles.

In order to define better the ground environment for large commercial aircraft, the National Aeronautics and Space Administration has undertaken a program to measure a runway and a taxiway profile at each of 10 to 15 United States international airports. The measurements have been completed at the first two airports (designated airports A and B), and the data are presented in this report in both plotted and tabular form.

AIRPORTS

Plan views of the runways and taxiways measured at each airport are shown in figure 1. Except for concrete inlays in the terminal apron, the pavements at airport A (fig. 1(a)) are flexible and range in thickness from $16\frac{1}{2}$ to $20\frac{1}{2}$ inches including subbase, base, and surface courses. The pavements at airport B are concrete and are 15 inches thick below the measured profiles.

MEASUREMENTS

Three-track runway and taxiway profiles were obtained by measuring the elevation at 2-foot intervals along the center track and along tracks 15 feet on each side of the center. The profiles were measured by conventional surveying methods using rod, level, and tape. Vertical control was required within the first order of accuracy (maximum permissible error in feet, 0.017 times the square root of the distance in miles), and the individual elevations were determined to the nearest 0.005 foot. The elevations were taken relative to an arbitrary 50-foot datum. The horizontal layout was established by use of third-order chaining methods without a closing loop to the origin. The horizontal layout of elevation stations is shown in figure 2. When elevation readings were taken, the rod was only required to be within 1 inch of the true station location.

RUNWAY AND TAXIWAY PROFILES

The profiles were measured at airport A during May and June 1968 and at Airport B during September 1968 and are shown in figure 3. At airport A, the three-track profiles were determined for a distance of 9400 feet along runway 15, for 3200 feet along taxiway C, and for 4400 feet along taxiway F. At airport B, the three-track profiles were determined for a distance of 9800 feet along runway 30 and for 9600 feet along taxiway N.

Figure 1 shows the location of the initial and final horizontal distance for each runway and taxiway profile that was measured and also the location of intersections with other runways and taxiways. The apparent reversal of grade lines between runway 30 and taxiway N at airport B (figs. 3(d) and 3(e)) is due to the measurements being initiated from an arbitrary 50-foot elevation datum at opposite ends of the field. (See fig. 1(b).)

The profiles plotted in figures 3(a), 3(b), 3(c), 3(d), and 3(e) are completely tabulated in tables I, II, III, IV, and V, respectively. These data can be made available on punched

electric accounting machine cards or on 1/2-inch magnetic computer tape in card image format. These arrangements may be made by contacting the author at:

CONCLUDING REMARKS

Three-track runway and taxiway profiles are presented for use in studies of airplane response to ground roughness. The profiles were obtained by measuring the elevation at 2-foot intervals along the center track and along tracks 15 feet on each side of the center. The elevations relative to an arbitrary datum were determined to the nearest 0.005 foot by conventional surveying methods. This report presents the tabulated and plotted profile data measured at two international airports (designated airports A and B).

OFFICIAL BUSINESS

FIRST CLASS MAIL

POSTAGE AND FEES PAID
NATIONAL AERONAUTICS
SPACE ADMINISTRATION

TO DISTRIBUTE: If Undeliverable (Section 1105 of the Postal Manual) Do Not Return

"The aeronautical and space activities of the United States shall be conducted so as to contribute . . . to the expansion of human knowledge of phenomena in the atmosphere and space. The Administration shall provide for the widest practicable and appropriate dissemination of information concerning its activities and the results thereof."

— NATIONAL AERONAUTICS AND SPACE ACT OF 1958

NASA SCIENTIFIC AND TECHNICAL PUBLICATIONS

TECHNICAL REPORTS: Scientific and technical information considered important, complete, and a lasting contribution to existing knowledge.

TECHNICAL NOTES: Information less broad in scope but nevertheless of importance as a contribution to existing knowledge.

TECHNICAL MEMORANDUMS: Information receiving limited distribution because of preliminary data, security classification, or other reasons.

CONTRACTOR REPORTS: Scientific and technical information generated under a NASA contract or grant and considered an important contribution to existing knowledge.

TECHNICAL TRANSLATIONS: Information published in a foreign language considered to merit NASA distribution in English.

SPECIAL PUBLICATIONS: Information derived from or of value to NASA activities. Publications include conference proceedings, monographs, data compilations, handbooks, sourcebooks, and special bibliographies.

TECHNOLOGY UTILIZATION PUBLICATIONS: Information on technology used by NASA that may be of particular interest in commercial and other non-aerospace applications. Publications include Tech Briefs, Technology Utilization Reports and Notes, and Technology Surveys.

Details on the availability of these publications may be obtained from:
